Covariance & Correlation

A Time Series Analyst's Crash Course

STAT 464 / 864 | Fall 2024
Discrete Time Series Analysis
Skyepaphora Griffith, Queen's University

We learned something on Wednesday, in Time Series 🕛

The S1 method

Eliminates seasonality Gives us a model for the data's noise. Yt

What did we tell quin?

Time to get Random

$$X_t = m_t + s_t + Y_t \quad (\star)$$

- We've removed the trend and seasonal components.
- Still gotta model the noise!

In time series, we're interested in **temporal** or **serial dependence**

If there is none? Then it's **noise**. $^{-}\setminus_{-}(\mathcal{Y})_{-}/^{-}$

We often measure this dependence using **correlation** (std. **covariance**)

Covariance | Definition

For random variables X and Y:

$$Cov(X, Y) = E\left[(X - E[X])(Y - E[Y]) \right]$$

Cov(X, Y) > 0 Positively correlated

Cov(X, Y) < 0 Negatively correlated

Cov(X, Y) = 0 Not correlated (uncorrelated)

Side Note: Expectation is Linear!

$$E\left[\sum_{i=1}^{N} c_{i} X_{i}\right] = \sum_{i=1}^{N} E[c_{i} X_{i}] = \sum_{i=1}^{N} c_{i} E[X_{i}]$$

Covariance | Alternative Formula

$$Cov(X,Y) = E[(X - E[X])(Y - E[Y])]$$

$$= E[XY - (X \cdot E[Y]) - (Y \cdot E[X]) + E[X] E[Y]]$$

$$= E[XY] - E[X \cdot E[Y]] - E[Y \cdot E[X]] + E[X] E[Y]$$

$$= E[XY] - E[Y] E[X] - E[X] E[Y] + E[X] E[Y]$$

$$= E[XY] - E[X] E[Y]$$

Covariance | Alternative Formula

$$Cov(X, Y) = E[XY] - E[X]E[Y]$$

Covariance Properties | Overview

C1) Symmetry
$$Cov(X, Y) = Cov(Y, X)$$

- C2) RVs are uncorrelated with constants Cov(c, X) = 0
- C3) Covariance is linear in both arguments
- C4) Variance = Covariance of RV with itself
- C5) Independent Uncorrelated
- C6) Cauchy-Schwarz: $Cov(X, Y)^2 \le Var(X)Var(Y)$

C3) Linearity in both arguments

$$\operatorname{Cov}\left(\sum_{i=1}^{m} a_i X_i, \sum_{j=1}^{n} b_j Y_j\right) = \sum_{i=1}^{m} \sum_{j=1}^{n} a_i b_j \operatorname{Cov}(X_i, Y_j)$$

$$Cov(a_1X_1 + a_2X_2, b_1Y_1 + b_2Y_2) = a_1b_1Cov(X_1, Y_1)$$

$$+ a_1b_2Cov(X_1, Y_2)$$

$$+ a_2b_1Cov(X_2, Y_1)$$

$$+ a_2b_2Cov(X_2, Y_2)$$

C4) Variance is Covariance

$$Cov(X, X) = E[X^{2}] - E[X]^{2}$$
$$= Var[X]$$

C4) Variance... like... really wants to be linear, but no

$$\operatorname{Var}\left(\sum_{i=1}^{n} a_{i} X_{i}\right) = \operatorname{Cov}\left(\sum_{i=1}^{n} a_{i} X_{i}, \sum_{j=1}^{n} a_{j} X_{j}\right)$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{n} a_{i} a_{j} \operatorname{Cov}(X_{i}, X_{j})$$

$$= \sum_{i=1}^{n} a_{i}^{2} \operatorname{Var}(X_{i}) + 2 \sum_{i=1}^{n} \sum_{j=1}^{n} a_{i} a_{j} \operatorname{Cov}(X_{i}, X_{j})$$

For uncorrelated RVs: variance of the sum = sum of the variance

C5a) Independent \Longrightarrow Uncorrelated

$$Cov(X, Y) = E[XY] - E[X]E[Y]$$
$$= 0$$

C5b) Independent $\not\leftarrow$ Uncorrelated

Let X have a symmetric distribution about 0

Assume $E[X^k]$ exists for $k \leq 3$

 $\mathrm{E}[X^k] = 0$ for all odd k, since such X^k are odd functions about 0

Let
$$Y = X^2$$
 $Cov(X, Y) = E[X \cdot X^2] - E[X]E[X^2]$
= $E[X^3] - E[X]E[X^2] = 0$

C6) Cauchy-Schwarz Inequality

$$0 \le E[(X - \lambda Y)^{2}] = E[X^{2} - 2\lambda XY + \lambda^{2}Y^{2}]$$
$$= E[X^{2}] - 2\lambda E[XY] + \lambda^{2}E[Y^{2}]$$

Minimize: take derivative with respect to λ

$$0 = -2E[XY] + 2\lambda E[Y^2]$$
$$\lambda = \frac{E[XY]}{E[Y^2]}$$

C6) Cauchy-Schwarz Inequality

$$0 \le \mathrm{E}[X^2] - 2\lambda \mathrm{E}[XY] + \mathrm{E}[\lambda^2 Y^2]$$

Plug in
$$\lambda$$

$$\lambda = \frac{E[XY]}{E[Y^2]}$$

$$= E[X^{2}] - \frac{2E[XY]}{E[Y^{2}]}E[XY] + \frac{E[XY]^{2}}{E[Y^{2}]^{2}}E[Y^{2}]$$

$$= E[X^{2}] - \frac{2E[XY]^{2}}{E[Y^{2}]} + \frac{E[XY]^{2}}{E[Y^{2}]}$$

$$= E[X^2] - \frac{E[XY]^2}{E[Y^2]}$$

C6) Cauchy-Schwarz Inequality

$$0 \le \mathrm{E}[X^2] - \frac{\mathrm{E}[XY]^2}{\mathrm{E}[Y^2]}$$

$$E[XY]^2 \le E[X^2]E[Y^2]$$

$$E[(X - E[X])(Y - E[Y])]^{2} \le E[(X - E[X])^{2}]E[(Y - E[Y])^{2}]$$

$$\operatorname{Cov}(X, Y)^2 \le \operatorname{Var}(X)\operatorname{Var}(Y)$$

Covariance vs. Correlation

Drawback of using covariance as measure of dependence: It depends on the units of the RVs.

Example:

If X, Y measured are in $cm \rightarrow 10X$ and 10Y are same quantities in mm

But notice: $Cov[10X, 10Y] = 100 Cov[X,Y] \rightarrow cov$ is not standardized.

Don't want the measure of dependence to change based on units

Correlation | Definition & Properties

Correlation coefficient:

$$\rho(X,Y) = \frac{\text{Cov}(X,Y)}{\sqrt{\text{Var}(X)\text{Var}(Y)}}$$

- 1) Symmetry (follows from symmetry of cov.)
- 2) Unitless, real valued on [-1, 1]
- 3) $\rho=\pm 1\iff Y$ is a linear function of X, ie) Y=a+bX

Proof Suppose Y= a+ bx for some nonzero constant b.

Then
$$Cov(X,Y) = Cov(X,a+bX)$$

 $= Cov(X,a) + b Cov(X,X)$
 $= b Var(X)$

Then
$$Cov(X,9) = Cov(X,490X)$$

$$= Cov(X,a) + b Cov(X,X)$$

$$= b Var(X)$$

$$Var(Y) = Var(a+bX) = b^2 Var(X)$$

(Cov (& 5) = 5 & 5, Cov (X,1)

$$= Cov(X,a) + b Cov(X,X)$$

$$= b Var(X)$$

Var (Y) = Var (a+b X) = b2 Var(X)

(3) g(x, y) = ±1 if and only if y is a linear function

 $50 p(X,Y) = \frac{b Var(X)}{\sqrt{Var(X)}b^2 Var(X)} = \frac{b}{|b|} = \pm 1$

So x - To is a constant with prob. 1

=> Y is a linear function of X.

of = Varly). Then

Conversely, suppose p(X, Y) = +1. Let ox = Var(X) and

Var (= Var (x) + Var (Y) -2 Cov (= Var (x))

=1+1-2p(X,Y)=0

We learned something Today, in Time Series 🕛

Cauchy Schwarz Inequality

 $\operatorname{Cov}(X,Y)^2 \le \operatorname{Var}(X)\operatorname{Var}(Y)$

Inner product space?

Functions E / Cov / Var of linear combos

What do we tell quin?
